<b>RESEARCH INTERESTS</b>	I'm interested in learning about and tackling hard problems by analyzing, designing, building and evaluating software systems. My current research focuses on systems providing data confidentiality, integrity and accounting.	
<b>EDUCATION</b>	<p><b>Ph.D. Candidate</b> co-advised by Peter Druschel &amp; Deepak Garg <a href="#">Max Planck Institute for Software Systems</a>, Saarbruecken, Germany</p> <p>2010 – Fall 2017</p> <p><b>Ph.D. Candidate</b> mentored by Holger Hermanns <a href="#">Saarland University</a>, Graduate School, Saarbruecken, Germany</p> <p>2009 – 2010</p> <p><b>Bachelor of Science</b> in Applied Computer Science <a href="#">Baden-Württemberg Cooperative State University Stuttgart (DHBW Stuttgart)</a> with <a href="#">IBM Germany</a> Thesis: "Distributed Complex Query Processing for Informix Dynamic Server" GPA: 1.5 (scale 1.0 to 5.0), First Class, Top 10%</p> <p>2006 – 2009</p> <p><b>Freie University of Berlin</b> "Mathematic for Computer Scientist I" during Senior High School</p> <p>2004</p>	
<b>SKILLS</b>	C, Java, PHP, SQL, Distributed & Storage & Operating Systems, Secure System Design, Trusted Computing, SSD/Flash Memory, Processors, Linux, Database Systems	
<b>ACADEMIC EXPERIENCE</b>	<p><b>Ph.D. Candidate</b> advised by Peter Druschel &amp; Deepak Garg <i>Guardat: a foundation for policy-protected persistent data</i> [EuroSys'15]</p> <p>Designed, built and evaluated Guardat, an architecture that enforces rich data access policies at the storage layer. Users, application developers and system administrators can provide per-file policies to Guardat. Guardat enforces these policies and provides attestations about the state of stored files. With Guardat, the data integrity, confidentiality and access accounting rules for a collection of files can be stated as a single declarative policy. Policy enforcement relies only on the integrity of the Guardat controller and any external policy dependencies; it does not depend on correct software, configuration and operator actions in other parts of a system. A prototype implementation of Guardat shows experimentally that the space and time overhead of making policy checks is low.</p> <p><i>Protecting Data Integrity with Storage Leases</i> [TechReport/Patent]</p> <p>With storage leases we describe a new storage primitive. Data stored under a lease cannot be written for a pre-determined period. During the lease period, online data is protected from corruption due to security breaches, software errors, or accidental data deletion. Storage leases fill an important gap in the spectrum of data protection options because they combine strong integrity for online data with the ability to eventually reclaim storage.</p> <p><b>Ph.D. Candidate</b> mentored by Holger Hermanns <i>A Verified Dependable Wireless Safety Critical Hard Real-Time Design</i> [WoWMoM'11]</p> <p>Wireless communication, hard real time requirements and safety criticality do not go well together. Our approach combines modeling, design, simulation, implementation and deployment of a small exemplary case that possesses all these features. State-of-the-art verification and simulation means are employed to ensure its proper operation.</p>	2010 - Present
<b>INDUSTRIAL EXPERIENCE</b>	<p><b>Research Software Engineering Intern</b> Microsoft Research, Redmond, WA</p> <p>Research opportunities to overcome performance and flexibility issues with Trusted Platform Module (TPM) Intel's new Software Guard Extension (SGX) instructions. Build and evaluate a prototype implementation. Mentor: Ronald Aigner (eXtreme Computing Group)</p>	Summer 2014

<b>INDUSTRIAL EXPERIENCE</b>	<b>Software Engineering Intern/Bachelor Thesis</b>	
	IBM, Boeblingen, Germany	Summer 2009
	Investigated the possibilities to distribute complex queries to Informix Dynamic Servers (IDS), introduced new query statistics for workload distribution. Mentor: Keshava Murthy (IDS Optimizer Architect).	
	IBM, Austin, Texas, USA	Summer 2008
	Designed, implemented and optimized a prototype library & framework of dynamic compute kernel fusion for Cell Broadband Engine Processor to reduce the data movement between processor cores and main memory improving performance particularly for chained matrix operations. Mentor: Dean J. Burdick (Multicore Software Architect)	
	IBM, Boeblingen, Germany	Summer 2007
	Analyzed binary search tree operations on Cell Broadband Engine processor – using parallel programming – increased performance of lookup tree operation by 35%.
